

Deep Learning Domain Adaptation

Vasileios Ilias Drouzas
Giannis Trantalidis

Professor: Themos Stafylakis

Contents

- Domain Adaptation
- Datasets: MNIST, SVHN, USPS
- Pre-processing
- Simple CNN
- DANN
- CORAL
- ADDA
- Benchmarking - Results
- Baseline scores
- Conclusions & Future Work

Datasets - MNIST

- ❖ MNIST
- ❖ Collection of handwritten digits
- ❖ 28 x 28 pixels
- ❖ 60000 examples
- ❖ Centered digits
- ❖ Grayscale images

Datasets - SVHN

- ❖ SVHN (Street View House Numbers)

- ❖ House Numbers

- ❖ 32 x 32 pixels RGB

- ❖ 73257 examples

- ❖ Non-centered digits

- ❖ 3 RGB channels

Datasets - USPS

- ❖ U.S. Postal Service
- ❖ Digit dataset automatically scanned from envelopes
- ❖ 16×16 pixel grayscale images
- ❖ 9,298 samples

Pre - processing

- ❖ Padded the MNIST images to 32x32 in order to match SVHN's dimensions
- ❖ MNIST: Repeat the single grayscale channel three times to create a 3-channel image
- ❖ Normalize to $[-1,1]$

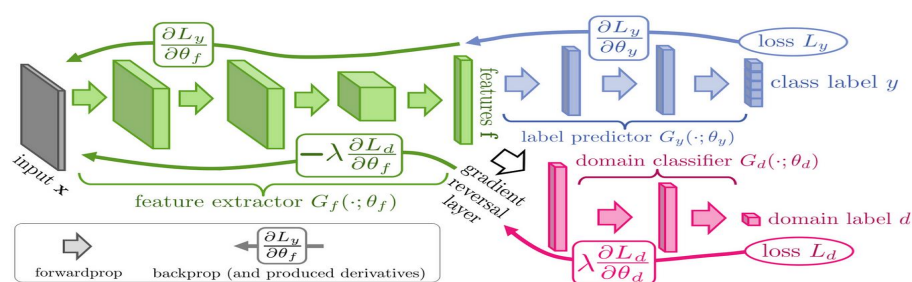

Algorithms

Simple CNN (Source only)

- ❖ We start with a very simple convolutional neural network with:
 - A convolutional layer: input 3 channels, output 16 channels, 3x3 kernel
 - Max - pooling layer
 - Fully connected layer
- ❖ CrossEntropyLoss
- ❖ Adam optimizer (learning rate: 0.001)

DANN (2014)

- ❖ Learn domain-invariant features
- ❖ Feature Extractor extracts features from input data.
- ❖ Domain classifier that encourages the feature extractor to produce features that are indistinguishable between source and target domains. (Using Gradient Reversal Layer after the feature extractor)

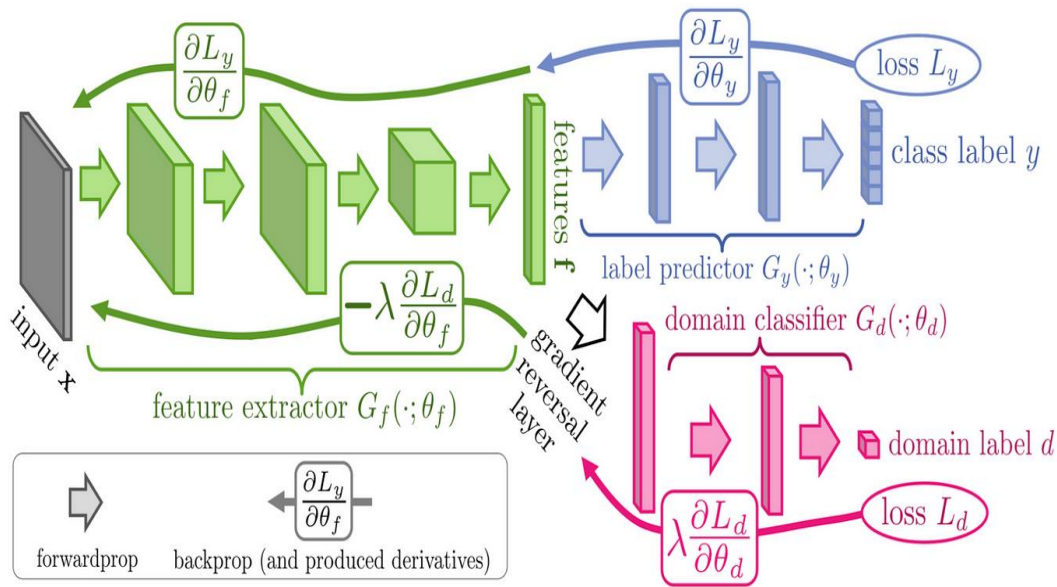

DANN (1/2)

❖ Feature Extractor

- Convolutional layers
- ReLU activations
- Max pooling layers
- Batch Normalization

❖ Label Classifier

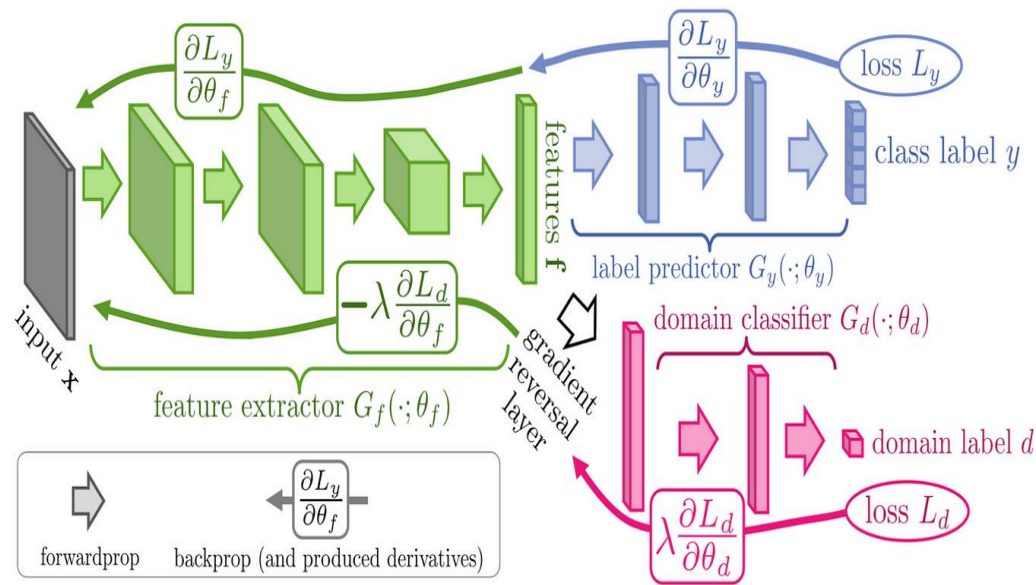

- Fully Connected Layers (classification)
- ReLU activations
- Batch Normalization
- Output layer

DANN (2/2)

❖ Domain Classifier

- Gradient Reversal layer
- Fully Connected layers
- Sigmoid Activation function
- Batch Normalization

CORAL

- ❖ Deep CORAL loss (minimizes domain shift)
- ❖ Aligns covariances of source & target domains
- ❖ Squared frobenius norm between batch covariances
- ❖ Normalize the loss

$$\ell_{CORAL} = \frac{1}{4d^2} \|C_S - C_T\|_F^2$$

ADDA (2017)

- 1 . Pre-train a source encoder CNN
2. Adversarial adaptation by learning a target encoder CNN such that a discriminator cant distinguish source vs target encoding

Discriminator trained to distinguish source vs target features - target encoder updates weights so that

Discriminator cant distinguish the features from the 2 domains.

Benchmarking - Results

Algorithm	MNIST \rightarrow SVHN	SVHN \rightarrow MNIST	MNIST \rightarrow USPS	USPS \rightarrow MNIST
Source Only	20.96%	51.63%	58.15%	32.50%
DANN	23.91%	66.71%	87.74%	76.66%
CORAL	22.87%	62.96%	86.35%	62.82%

State-of-the-art scores

Methods	Source Target	MNIST USPS	USPS MNIST	SVHN MNIST	MNIST SVHN
Source Only		78.9	57.1 \pm 1.7	60.1 \pm 1.1	20.23 \pm 1.8
w/o augmentation
